Conclusion

- Planted matching  $M^*$  uniformly distributed in all perfect matchings.
- Edges not in  $M^*$  appear independently w.p.  $\frac{d}{n}$ .
- Edge weight

$$W_e \stackrel{\text{ind.}}{\sim} \begin{cases} P & e \in M^* \\ Q & e \notin M^* \end{cases}$$

# Main results

## Theorem (Ding-Wu-Xu-Y '21)

Sharp threshold for almost perfect recovery :

- If  $\sqrt{d}B(\mathcal{P}, \mathcal{Q}) \leq 1$ , then some  $\hat{M}$  achieves

$$\frac{1}{n} \mathbb{E} \left| \hat{M} \Delta M^* \right| \rightarrow 0 \text{ as } n \rightarrow \infty.$$

- If  $\sqrt{d}B(\mathcal{P}, \mathcal{Q}) \geq 1 + \epsilon$  for  $\epsilon > 0$ , then for all  $\hat{M}$  and some constant  $c$ ,

$$\frac{1}{n} \mathbb{E} \left| \hat{M} \Delta M^* \right| \geq c.$$

Bhattacharyya coefficient (Hellinger affinity)  $B(\mathcal{P}, \mathcal{Q}) \triangleq \int \sqrt{d\mathcal{P}d\mathcal{Q}}$ .

# Main results

## Theorem (Ding-Wu-Xu-Y '21)

Sharp threshold for almost perfect recovery :

- If  $\sqrt{d}B(\mathcal{P}, \mathcal{Q}) \leq 1$ , then some  $\hat{M}$  achieves

$$\frac{1}{n} \mathbb{E} \left| \hat{M} \Delta M^* \right| \rightarrow 0 \text{ as } n \rightarrow \infty.$$

- If  $\sqrt{d}B(\mathcal{P}, \mathcal{Q}) \geq 1 + \epsilon$  for  $\epsilon > 0$ , then for all  $\hat{M}$  and some constant  $c$ ,

$$\frac{1}{n} \mathbb{E} \left| \hat{M} \Delta M^* \right| \geq c.$$

Bhattacharyya coefficient (Hellinger affinity)  $B(\mathcal{P}, \mathcal{Q}) \triangleq \int \sqrt{d\mathcal{P}d\mathcal{Q}}$ .

- Result works for both sparse ( $d$  bounded) and dense ( $d \rightarrow \infty$ ) graphs.
- In the dense  $d \rightarrow \infty$  regime, need certain scaling assumptions on  $\mathcal{Q}$ .

# Examples

## Exponential model (dense regime) [Maharrami-Moore-Xu '19,

Semerjian-Sicuro-Zdeborová '20] :

- $d = n$ ,  $P = \text{Exp}(\lambda)$ ,  $Q = \text{Exp}(1/n)$ .
- Sharp threshold :  $\lambda = 4$ .

The Planted  
Matching

Problem: Sharp  
Threshold and  
Infinite-order  
Phase Transition

Dana Yang

Model and result

Analysis

Exponential  
model

Conclusion

# Examples

## Unweighted model (sparse regime) :

- $d = \text{const}$ ,  $P = Q$ .
- The edge weights do not offer any information for recovery.
- Sharp threshold :  $d = 1$ .

The Planted  
Matching

Problem: Sharp  
Threshold and  
Infinite-order  
Phase Transition

Dana Yang

Model and result

Analysis

Exponential  
model

Conclusion

## Crucial observations

- 1 Sampling from the posterior distribution is optimal within a factor of two.

**Proof :** Let  $\tilde{M}$  be sampled from the posterior distribution, then for any estimator  $\hat{M}$ ,

$$\mathbb{E} \left| \tilde{M} \Delta M^* \right| \leq \mathbb{E} \left| \tilde{M} \Delta \hat{M} \right| + \mathbb{E} \left| \tilde{M} \Delta M^* \right| = 2\mathbb{E} \left| \hat{M} \Delta M^* \right|,$$

where the equality is because  $\mathcal{L}(G, \tilde{M}) = \mathcal{L}(G, M^*)$ .

# Analysis for $d \geq 1 + \epsilon$

## Crucial observations

- 1 Sampling from the posterior distribution is close to optimal.
- 2 The posterior distribution is uniform over the set of all perfect matchings in  $G$ .

Analysis

Exponential  
model

Conclusion

# Conclusion

- Sharp threshold for almost perfect recovery under the planted matching model :  $\sqrt{d}B(\mathcal{P}, \mathcal{Q}) = 1$ .
- Infinite-order phase transition under the exponential model : optimal reconstruction error is  $\exp(-\Theta(1/\sqrt{\epsilon}))$  when  $\lambda = 4 - \epsilon$ .
- Key idea : two-stage cycle finding (path construction + sprinkling).

Analysis

Exponential  
model

Conclusion

## Planted matching model (general)

True matching  $M^* \sim \text{Unif}\{\text{all perfect matchings on } [n] \times [n]'\}$ .  
Observed graph  $G$  contains all the edges in  $M^*$ , and for each  $e \notin M^*$ ,  
 $e \in G$  independently with probability  $d/n$ . Observe  $(W_e)_{e \in G}$ , where

$$W_e \stackrel{\text{indep.}}{\sim} \begin{cases} \mathcal{P} & \text{if } e \in M^* \\ \mathcal{Q} & \text{if } e \notin M^*. \end{cases}$$

Analysis

Exponential  
model

Conclusion

# Analysis (lower bound)

- Follow the two-stage cycle finding scheme.
- For the path construction stage, the exploration + selection scheme is too wasteful.

## Path construction (exponential model)

- 1 Directly show the existence of many **short augmenting alternating** paths using first and second moment method.
  - Impose **uniformity** (bounded weight fluctuation on paths) to reduce second moment [Ding '13, Ding-Sun-Wilson '15].

# Analysis (lower bound)

- Follow the two-stage cycle finding scheme.
- For the path construction stage, the exploration + selection scheme is too wasteful.

## Path construction (exponential model)

- 1 Directly show the existence of many **short augmenting alternating** paths using first and second moment method.
  - Impose **uniformity** (bounded weight fluctuation on paths) to reduce second moment [Ding '13, Ding-Sun-Wilson '15].
- 2 Extract a large collection of **vertex-disjoint** paths via Turán's Theorem [Ding-Goswami '15].
