POLITICAL SCIENCE ■

# Travelling salesman problem

Given  $n$  cities and their pairwise distances, find a shortest tour visiting all  $n$  cities.

- One of the best known **NP-hard** optimization problems
- Studied since the 19<sup>th</sup> century
- **Symmetric TSP**:  $d(i, j) = d(j, i) \quad \forall i, j$
- **Asymmetric TSP**:  $d(i, j) \neq d(j, i)$  is possible

UK pub tour  
[Cook et al., 2015]

Triangle inequality:  
 $d(i, j) \leq d(i, k) + d(k, j) \quad \forall i, j, k$

# Symmetric vs Asymmetric TSP

## Symmetric TSP

- 1.5-approximation algorithm [Christofides '76]
- **Graphic TSP**: unweighted graph shortest path metric
  - Current best 1.4 [Sebő & Vygen '14], following
    - [Oveis Gharan, Saberi & Singh '11]
    - [Mömke & Svensson '11]
    - [Mucha '12]

# Symmetric vs Asymmetric TSP

## Asymmetric TSP

- $\log_2 n$ -approximation algorithm [Frieze, Galbiati & Maffioli '82]
- $0.99 \log_2 n$  [Bläser '03]
- $0.84 \log_2 n$  [Kaplan, Lewenstein, Shafrir & Sviridenko '03]
- $0.67 \log_2 n$  [Feige & Singh '07]
- $O\left(\frac{\log gn}{\log \log gn}\right)$  [Asadpour, Goemans, Mądry, Oveis Gharan & Saberi '10]  
via thin trees.

# Asymmetric TSP – recent developments

- $O(\text{poly log log } n)$  bound on integrality gap of LP [Anari & Oveis Gharan '15]

## Constant-factor approximations:

- Bounded genus graphs [Oveis Gharan & Saberi '11]
- Node-weighted graphs [Svensson '15]
- Graphs with 2 edge weights [Svensson, Tarnawski & V. '16]

Our result: constant-factor approximation for general ATSP with respect to the Held-Karp relaxation.

# ATSP – Graphic formulation

Input: directed graph  $G = (V, E)$ , edge weights  $w: E \rightarrow \mathbb{R}_+$   
Find a minimum weight **tour**  $F$ .

- **Tour** = closed walk visiting every vertex at least once =  
= Eulerian and connected edge multiset
- **Eulerian**:  $\delta_F^{in}(v) = \delta_F^{out}(v) \forall v \in V$
- **Subtour** = closed walk (not necessarily connected)

In-degree & out-degree in F

# ATSP – Graphic formulation

In-degree & out-degree in F

# Held-Karp relaxation

- Input:  $G = (V, E)$ , edge weights  $w: E \rightarrow \mathbb{R}_+$ .
- Variables  $x_e: E \rightarrow \mathbb{R}_+$  : multiplicity of selecting edge  $e$ .

minimize  $w^\top x$

subject to  $x(\delta^{in}(v)) = x(\delta^{out}(v)) \quad \forall v \in V$

$x(\delta(S)) \geq 2 \quad \forall S \subsetneq V, S \neq \emptyset$

$x \geq 0$

Eulerian degree  
constraints

Subtour elimination  
constraints

Undirected degree:

$$\delta(S) = \delta^{in}(S) + \delta^{out}(S)$$

# Held-Karp relaxation

- Input:  $G = (V, E)$ , edge weights  $w: E \rightarrow \mathbb{R}_+$ .
- Variables  $x_e: E \rightarrow \mathbb{R}_+$  : multiplicity of selecting edge  $e$ .

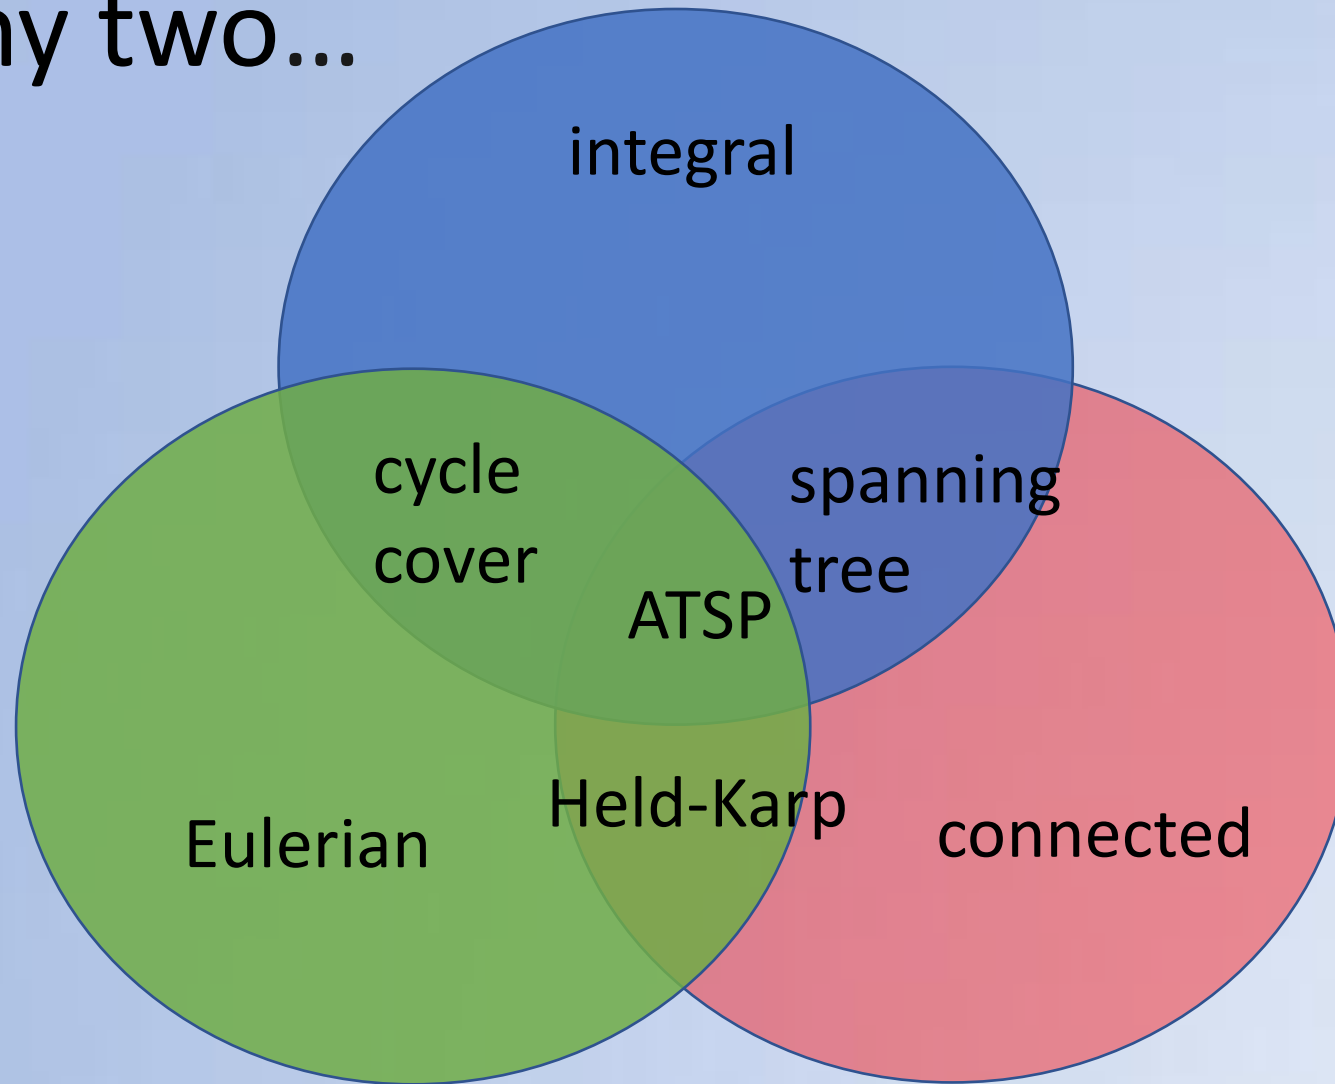

$$\begin{aligned} &\text{minimize} && w^\top x \\ &\text{subject to} && x(\delta^{in}(v)) = x(\delta^{out}(v)) \quad \forall v \in V \\ & && x(\delta(S)) \geq 2 \quad \forall S \subsetneq V, S \neq \emptyset \\ & && x \geq 0 \end{aligned}$$

- Can be solved in polynomial time
- Integrality gap  $\geq 2$   
[Charikar, Goemans & Karloff '06]

Pick any two...

Pick any two...

# Repeated cycle cover algorithm [Frieze, Galbiati & Maffioli '82]

Relaxing connectivity:

1. Find minimum weight cycle cover
2. Contract and repeat

- Each cycle cover has cost  $\leq OPT$
- Overall  $\log_2 n$  rounds
- $\log_2 n$  approximation

# Node-weighted case [Svensson'15]

Directed graph  $G = (V, E)$ , node weights  $h: V \rightarrow \mathbb{R}_+$   
 $w(u, v) = h(u) + h(v) \quad \forall u, v \in E$

**Local-Connectivity ATSP:** relaxing connectivity constraints to “local”

$\alpha$ -light algorithm for  
Local-Connectivity ATSP

$(9 + \varepsilon)\alpha$ -approximation  
for ATSP

Theorem [Svensson'15]  
There exists a polytime  $(27 + \varepsilon)$ -  
approximation for node-weighted ATSP.

# Dual of the Held-Karp relaxation

minimize  $w^\top x$

subject to

$$\begin{aligned}x(\delta^{in}(v)) &= x(\delta^{out}(v)) \quad \forall v \in V \\x(\delta(S)) &\geq 2 \quad \forall \emptyset \neq S \subsetneq V \\x &\geq 0\end{aligned}$$

maximize  $2 \sum_{\emptyset \neq S \subsetneq V} y_S$

subject to

$$\begin{aligned}\sum_{S:(u,v) \in \delta(S)} y_S + \alpha_u - \alpha_v &\leq w(u,v) \quad \forall (u,v) \in E \\y &\geq 0\end{aligned}$$

- Dual can be solved in polynomial time.
- One can efficiently find an optimal  $(\alpha, y)$  such that the support of  $y$  is a **laminar family** of sets.  
Efficient uncrossing [Karzanov'96]

# Laminarly weighted ATSP: $\mathcal{J} = (G, \mathcal{L}, x, y)$

minimize  $w^\top x$

subject to

$$\begin{aligned} x(\delta^{in}(v)) &= x(\delta^{out}(v)) \quad \forall v \in V \\ x(\delta(S)) &\geq 2 \quad \forall \emptyset \neq S \subsetneq V \\ x &\geq 0 \end{aligned}$$

maximize  $2 \sum_{\emptyset \neq S \subsetneq V} y_S$

subject to

$$\begin{aligned} \sum_{S: (u,v) \in \delta(S)} y_S + \alpha_u - \alpha_v &\leq w(u,v) \quad \forall (u,v) \in E \\ y &\geq 0 \end{aligned}$$

- $G$ : directed graph
- $\mathcal{L}$ : laminar family of sets
- $x$ : feasible Held-Karp solution  
tight on every set in  $\mathcal{L}$ :  $x(\delta(S)) = 2 \quad \forall S \in \mathcal{L}$
- $y: \mathcal{L} \rightarrow \mathbb{R}_+$

# Laminarly weighted ATSP: $\mathcal{J} = (G, \mathcal{L}, x, y)$

minimize  $w^\top x$

subject to

$$\begin{aligned} x(\delta^{in}(v)) &= x(\delta^{out}(v)) \quad \forall v \in V \\ x(\delta(S)) &\geq 2 \quad \forall \emptyset \neq S \subsetneq V \\ x &\geq 0 \end{aligned}$$

maximize  $2 \sum_{\emptyset \neq S \subsetneq V} y_S$

subject to

$$\begin{aligned} \sum_{S:(u,v) \in \delta(S)} y_S + \alpha_u - \alpha_v &\leq w(u,v) \quad \forall (u,v) \in E \\ y &\geq 0 \end{aligned}$$

- $G$ : directed graph
- $\mathcal{L}$ : laminar family of sets
- $x$ : feasible Held-Karp solution  
tight on every set in  $\mathcal{L}$ :  $x(\delta(S)) = 2 \quad \forall S \in \mathcal{L}$
- $y: \mathcal{L} \rightarrow \mathbb{R}_+$

Induced weight function:  $w(u,v) = \sum_{S:(u,v) \in \delta(S)} y_S$

# Laminarly weighted ATSP: $\mathcal{J} = (G, \mathcal{L}, x, y)$

minimize  $w^\top x$

subject to

$$\begin{aligned} x(\delta^{in}(v)) &= x(\delta^{out}(v)) \quad \forall v \in V \\ x(\delta(S)) &\geq 2 \quad \forall \emptyset \neq S \subsetneq V \\ x &\geq 0 \end{aligned}$$

maximize  $2 \sum_{\emptyset \neq S \subsetneq V} y_S$

subject to

$$\begin{aligned} \sum_{S:(u,v) \in \delta(S)} y_S + \alpha_u - \alpha_v &\leq w(u,v) \quad \forall (u,v) \in E \\ y &\geq 0 \end{aligned}$$

- $G$ : directed graph
- $\mathcal{L}$ : laminar family of sets
- $x$ : feasible Held-Karp solution  
tight on every set in  $\mathcal{L}$ :  $x(\delta(S)) = 2 \quad \forall S \in \mathcal{L}$
- $y: \mathcal{L} \rightarrow \mathbb{R}_+$

Induced weight function:  $w(u,v) = \sum_{S:(u,v) \in \delta(S)} y_S$

# Reduction to laminarly weighted ATSP

- Start with any  $G$  and  $w$ .
- Compute Held-Karp optimal solution  $x$  and dual  $y$  supported on laminar family  $\mathcal{L}$
- Delete all edges with  $x_e = 0$ .

$$\text{maximize} \quad 2 \sum_{\emptyset \neq S \subseteq V} y_S$$

subject to

$$\sum_{S:(u,v) \in \delta(S)} y_S + \alpha_u - \alpha_v \leq w(u, v) \quad \forall (u, v) \in E$$
$$y \geq 0$$

Observations:

- Optimal solutions and optimum value are the same for  $w$  and for

$$w'(u, v) = w(u, v) + \alpha_v - \alpha_u$$

- All remaining edges have

$$w'(u, v) = \sum_{S:(u,v) \in \delta(S)} y_S$$

# Roadmap

Vertebrate pairs

$O(1)$ -light lCATSP  
algorithm in  
vertebrate pairs

Local-connectivity  
ATSP

[Svensson '15]

Graph theory:  
contractions

# Vertebrate pairs

Vertebrate pair  $(\mathcal{J}, B)$

- $\mathcal{J} = (G, \mathcal{L}, x, y)$  instance
- $B$ : backbone = subtour that crosses every nonsingleton set in  $\mathcal{L}$

# Vertebrate pairs

- We will reduce general ATSP to solving ATSP for a vertebrate pair  $(\mathcal{J}, B)$  with  $w(B) = \Theta(OPT)$  (more or less...)
- Solve Local-Connectivity ATSP on such instances, and apply [Svensson'15]

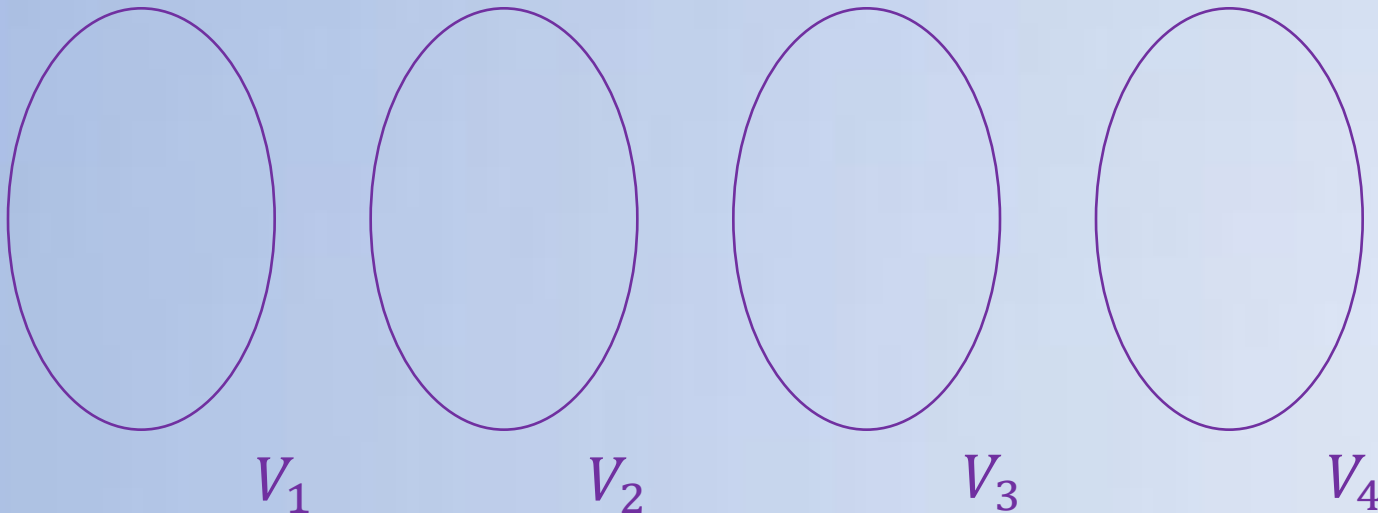

# Local-Connectivity ATSP [Svensson'15]

Instance  $\mathcal{J} = (G, \mathcal{L}, x, y)$  with induced weights  $w: E \rightarrow \mathbb{R}_+$

Lower bound function  $\text{lb}: V \rightarrow \mathbb{R}_+$  with  $\sum_{v \in V} \text{lb}(v) = OPT$

Input: partition of the vertex set  $V = V_1 \cup V_2 \cup \dots \cup V_k$

# Local-Connectivity ATSP [Svensson'15]

Instance  $\mathcal{I} = (G, \mathcal{L}, x, y)$  with induced weights  $w: E \rightarrow \mathbb{R}_+$

Lower bound function  $\text{lb}: V \rightarrow \mathbb{R}_+$  with  $\sum_{v \in V} \text{lb}(v) = OPT$

Input: partition of the vertex set  $V = V_1 \cup V_2 \cup \dots \cup V_k$

Output: Eulerian edge set  $F$  with  $|\delta(V_i) \cap F| > 0$  for each  $V_i$

# Local-Connectivity ATSP [Svensson'15]

Instance  $\mathcal{I} = (G, \mathcal{L}, x, y)$  with induced weights  $w: E \rightarrow \mathbb{R}_+$

Lower bound function  $\text{lb}: V \rightarrow \mathbb{R}_+$  with  $\sum_{v \in V} \text{lb}(v) = OPT$

Input: partition of the vertex set  $V = V_1 \cup V_2 \cup \dots \cup V_k$

Output: Eulerian  $F$  with  $|\delta(V_i) \cap F| > 0$  for each  $V_i$

$\alpha$ -light algorithm: for every component  $C$  of  $F$ ,

$$\frac{w(E(C))}{\text{lb}(V(C))} \leq \alpha$$

“Every component pays for itself locally”

# Local-Connectivity ATSP [Svensson'15]

$\alpha$ -light algorithm for  
Local-Connectivity ATSP

$(9 + \varepsilon)\alpha$ -approximation  
for ATSP

Theorem [Svensson'15]  
There exists a polytime  $(27 + \varepsilon)$ -  
approximation for node-weighted ATSP.

# Local-Connectivity ATSP: node-weighted case

- Instance  $\mathcal{I} = (G, \mathcal{L}, x, y)$ , with  $\mathcal{L}$  containing only singletons (ignore  $B$ )  
 $w(u, v) = y_{\{u\}} + y_{\{v\}}$
- Define  $\text{lb}(u) = 2y_{\{u\}} \quad \forall u \in V$
- Partition  $V = V_1 \cup V_2 \cup \dots \cup V_k$  all strongly connected
- Modify  $G$  and  $x$ , and solve an integer circulation problem

# Local-Connectivity ATSP: node-weighted case

- Instance  $\mathcal{I} = (G, \mathcal{L}, x, y)$ , with  $\mathcal{L}$  containing only singletons (ignore  $B$ )  
 $w(u, v) = y_{\{u\}} + y_{\{v\}}$
- Define  $\text{lb}(u) = 2y_{\{u\}} \quad \forall u \in V$
- Partition  $V = V_1 \cup V_2 \cup \dots \cup V_k$  all strongly connected
- Modify  $G$  and  $x$ , and solve an integer circulation problem

- For each  $V_i$ , create auxiliary vertex  $a_i$
- Reroute 1 fractional unit of incoming and outgoing flow  $x$  to  $a_i$
- Solve integer circulation problem routing =1 unit through each  $a_i$
- Map back to original  $G$

# Local-Connectivity ATSP: node-weighted case

- The rerouted  $x$  is feasible to the circulation problem of weight  $OPT$
- **Flow integrality:** there exists integer solution of weight  $\leq OPT$
- After mapping back, every vertex with  $y_v > 0$  has in-degree  $\leq 2$
- For a component  $C$ ,  $w(E(C)) = \sum_{(u,v) \in E(C)} y_{\{u\}} + y_{\{v\}} \leq 4 \sum_{v \in C} y_{\{v\}}$
- $lb(V(C)) = 2 \sum_{v \in C} y_{\{v\}} \Rightarrow$  **2-light algorithm**

# Local-Connectivity ATSP: one nonsingular set in $\mathcal{L}$

- Vertebrate pair  $(\mathcal{J}, B)$ . Assume  $\mathcal{L}$  has a single non-singleton component  $S$ . Thus,

$$w(u, v) = \begin{cases} y_{\{u\}} + y_{\{v\}} + y_S & \text{if } f(u, v) \in \delta(S) \\ y_{\{u\}} + y_{\{v\}} & \text{if } f(u, v) \notin \delta(S) \end{cases}$$

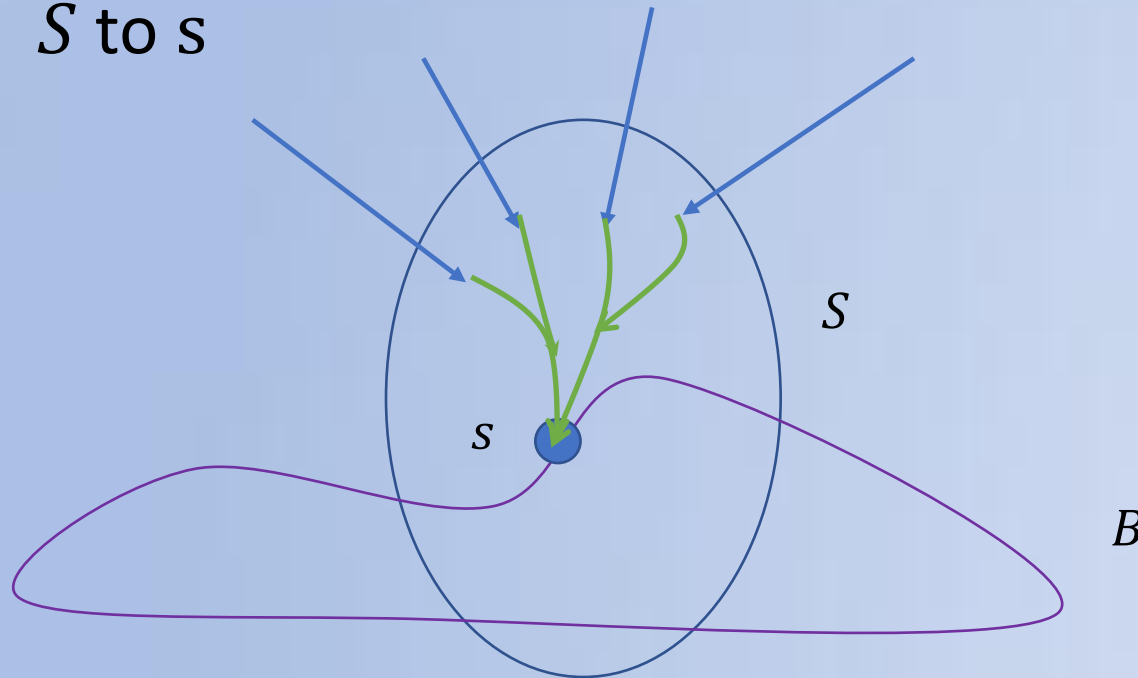

- Define

$$\text{lb}(u) = \begin{cases} 2y_{\{u\}} & \text{if } u \in V \setminus V(B) \\ \frac{w(B)}{|V(B)|} & \text{if } u \in V(B) \end{cases}$$

- $\sum_{v \in V} \text{lb}(v) = O(OPT)$ , since  $w(B) = \Theta(OPT)$

# Local-Connectivity ATSP: one nonsingular set in $\mathcal{L}$

- By assumption,  $x(\delta^{in}(S)) = x(\delta^{out}(S)) = 1$
- Backbone property: there is a node  $s \in V(B) \cap S$
- Simple flow argument: we can route the incoming 1 unit of flow to  $S$  to  $s$

# Local-Connectivity ATSP: one nonsingular set in $\mathcal{L}$

- Partition  $V = V_1 \cup V_2 \cup \dots \cup V_k$
- Add backbone  $B$  into Eulerian set  $F$ .
- Via flow splitting, “force” all edges entering  $S$  to proceed to  $s \in V(B)$
- Create auxiliary vertices  $a_i$  as before
- Solve integral circulation problem, and add solution to  $F$ .

# Local-Connectivity ATSP: one nonsingular set in $\mathcal{L}$

## Analysis

- For all components  $C$  not crossing  $S$ ,  $w(E(C))/\text{lb}(V(C)) \leq 2$  exactly as in the node-weighted case
- Giant component  $C_0$  containing  $B$ .
  - Contains all edges crossing  $S$
  - Has lower bound  $\text{lb}(V(C_0)) \geq \text{lb}(V(B)) = \Theta(OPT)$
  - $w(E(C_0)) \leq w(F) \leq O(OPT)$
- Therefore solution is  $O(1)$ -light.
- Same approach extends to arbitrary  $\mathcal{L}$ : enforce that every subtour crossing a set in  $\mathcal{L}$  must intersect the backbone.

# Roadmap

Local-connectivity  
ATSP

[Svensson'15]

Graph theory:  
contractions

# Motivation: reducing by contraction

- All sets in the family  $\mathcal{L}$  are singletons: node-weighted ATSP
- Would like to reduce the problem by contracting nonsingleton sets in  $\mathcal{L}$

# Motivation: reducing by contraction

- All sets in the family  $\mathcal{L}$  are singletons: node-weighted ATSP
- Would like to reduce the problem by contracting nonsingleton sets in  $\mathcal{L}$

# Motivation: reducing by contraction

- All sets in the family  $\mathcal{L}$  are singletons: node-weighted ATSP
- Would like to reduce the problem by contracting nonsingleton sets in  $\mathcal{L}$

# Irreducible instances

- Irreducible set  $S \in \mathcal{L}$ :  
There exists  $u, v \in S$   
such that the shortest  
path between  $u$  and  $v$   
inside  $S$  visits “almost  
all” sets  $X \subseteq S, X \in \mathcal{L}$
- Irreducible instance  
 $\mathcal{I} = (G, \mathcal{L}, x, y)$ :  
all sets in  $\mathcal{L}$  are  
irreducible

# Irreducible instances

- Irreducible set  $S \in \mathcal{L}$ :  
There exists  $u, v \in S$   
such that the shortest  
path between  $u$  and  $v$   
inside  $S$  visits “almost  
all” sets  $X \subseteq S, X \in \mathcal{L}$
- Irreducible instance  
 $\mathcal{I} = (G, \mathcal{L}, x, y)$ :  
all sets in  $\mathcal{L}$  are  
irreducible

# Irreducible instances

- **Reducible set  $S \in \mathcal{L}$ :** For every pair  $u, v \in S$ , there is a “cheap” path connecting them (if they are connected).
- Reducible sets can be contracted.

## **Theorem:**

polytime  $\rho$ -approximation for irreducible instances

# Vertebrate pairs

Vertebrate pair  $(\mathcal{J}, B)$

- $\mathcal{J} = (G, \mathcal{L}, x, y)$  instance
- $B$ : backbone = subtour that crosses every nonsingleton set in  $\mathcal{L}$

# Finding a vertebrate pair in an irreducible instance $\mathcal{J} = (G, \mathcal{L}, x, y)$

1. Obtain a node-weighted instance by contracting all maximal sets in  $\mathcal{L}$
2. Use [Svensson '15] to find a tour here, and blow it back to a subtour  $B$  in the original instance  $\mathcal{J}$  in a pessimistic way:  
inside each maximal  $S \in \mathcal{L}$ ,  $B$  crosses  $\geq 0.75 \text{value}(S)$
3. If it crosses every set in  $\mathcal{L}$ , then  $(\mathcal{J}, B)$  is a vertebrate pair
4. Otherwise, recurse by contracting all maximal sets in  $\mathcal{L}$  not crossed by  $B$ .  
This works because their total weight is  $\leq 0.25 \text{value}(\mathcal{J})$

# Roadmap

$O(1)$ -light lCATSP  
algorithm in  
vertebrate pairs

Local-connectivity  
ATSP

[Svensson '15]

# Summary

- Via all these reductions, we obtain an **5500**-approximation algorithm for ATSP.
- Squeezing the arguments a bit more and opening up black boxes, can be probably decreased to a few hundreds.
- Still very far from lower bound 2 on the integrality gap of Held-Karp

## Open questions

- Improve to a constant  $< 100$
- **Thin tree** conjecture is still open.
- Bottleneck ATSP.
- Better than  $3/2$  approximation for symmetric TSP.

# Simplifying assumption *for the talk*

**Assumption:** all sets in the family  $\mathcal{L}$  are strongly connected in  $G$ .

Not true in general, but the connected components have a nice path structure:

# Paths traversing a set

- How much is the weight of connecting an incoming and an outgoing edge in a set  $S \in \mathcal{L}$ ?

$$D_S(u, v) =$$

# Paths traversing a set

- How much is the weight of connecting an incoming and an outgoing edge in a set  $S \in \mathcal{L}$ ?

$$D_S(u, v) = \sum_{R: u \in R, R \subsetneq S} y_R$$

# Paths traversing a set

- How much is the weight of connecting an incoming and an outgoing edge in a set  $S \in \mathcal{L}$ ?

$$D_S(u, v) = \sum_{R: u \in R, R \subsetneq S} y_R + d_S(u, v)$$

Min weight path inside  $S$ .

# Paths traversing a set

- How much is the weight of connecting an incoming and an outgoing edge in a set  $S \in \mathcal{L}$ ?

$$D_S(u, v) = \sum_{R: u \in R, R \not\subseteq S} y_R + d_S(u, v) + \sum_{R: v \in R, R \not\subseteq S} y_R = 18$$

# Paths traversing a set

- How much is the weight of connecting an incoming and an outgoing edge in a set  $S \in \mathcal{L}$ ?

$$D_S(u, v) = \sum_{R: u \in R, R \not\subseteq S} y_R + d_S(u, v) + \sum_{R: v \in R, R \not\subseteq S} y_R = 18 \leq 38$$

**Lemma:**

$$D_S(u, v) \leq 2 \sum_{R \not\subseteq S} y_R = \text{value}(S)$$

# Irreducible instances

- Reducible set  $S \in \mathcal{L}$ :

$$\text{Max}_{u,v \in S} D_S(u, v) \leq \frac{3}{4} \text{value}(S)$$

- Irreducible instance  $\mathcal{I} = (G, \mathcal{L}, x, y)$ :  
no set  $S \in \mathcal{L}$  is reducible

**Lemma:**

$$D_S(u, v) \leq 2 \sum_{R \subsetneq S} y_R = \text{value}(S)$$

**Theorem:**

polytime  $\rho$ -approximation for  
irreducible instances  $\Rightarrow$   
polytime  $8\rho$ -approximation for  
arbitrary instances

# Recursive algorithm via contractions

- Instance  $\mathcal{J} = (G, \mathcal{L}, x, y)$
- $value(\mathcal{J}) = 2 \sum_{R \subseteq V} \mathcal{Y}_R$   
= Held-Karp optimum
- $S$ : minimal reducible set in  $\mathcal{L}$ .

$$value(\mathcal{J}) = 64$$

$8\rho$ -approximation for  $\mathcal{J} =$   
 $8\rho$ -approximation on instance by contracting  $S$   
+  
 $\rho$ -approximation of irreducible instance "inside"  $S$

# Recursive algorithm via contractions

- Instance  $\mathcal{J} = (G, \mathcal{L}, x, y)$
- $value(\mathcal{J}) = 2 \sum_{R \subseteq V} y_R$   
=Held-Karp optimum
- $S$ : minimal reducible set in  $\mathcal{L}$ .
- $\mathcal{J}' = \mathcal{J}/S$ : contract  $S$  in  $\mathcal{J}$ .
- $S \rightarrow s$
- $y_{\{s\}} = y_S + \frac{3}{8} value(S)$
- $value(\mathcal{J}') = value(\mathcal{J}) - \frac{1}{4} value(S)$

# Recursive algorithm via contractions

**Inductive assumption:** We have a polytime  $8\rho$ -approximation for smaller instances

- Apply recursively on  $\mathcal{J}'$  to obtain tour  $T'$

$$w(T') \leq 8\rho \text{value}(\mathcal{J}')$$

$$= 8\rho \left( \text{value}(\mathcal{J}) - \frac{1}{4} \text{value}(S) \right)$$

# Contracting $S$

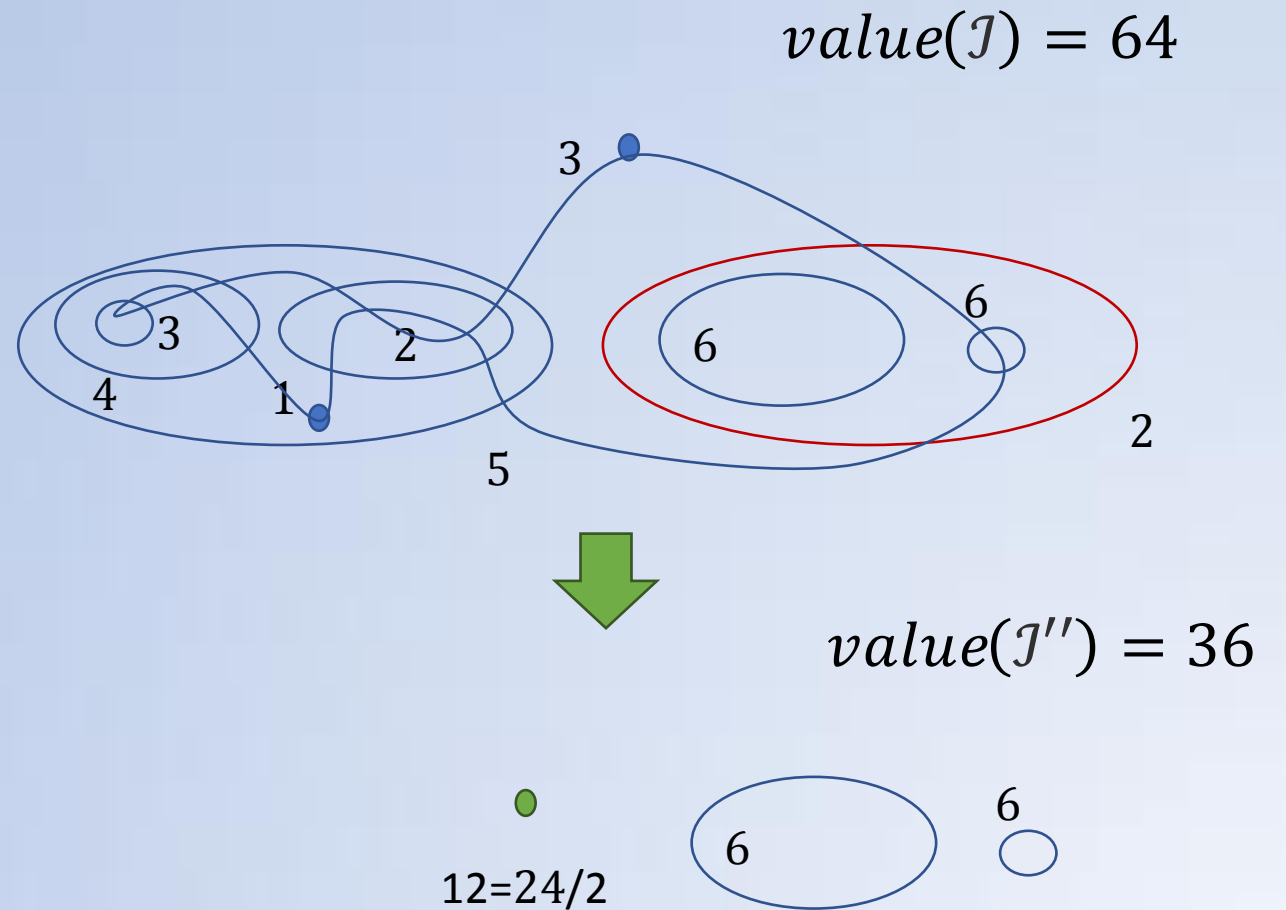

**Inductive assumption:** We have a polytime  $8\rho$ -approximation for smaller instances

- Apply recursively on  $\mathcal{J}'$  to obtain tour  $T'$   
 $w(T') \leq 8 \text{value}(\mathcal{J}')$   
 $= 8\rho(\text{value}(\mathcal{J}) - \frac{1}{4} \text{value}(S))$
- Map back to subtour  $T$  in  $\mathcal{J}$  with  $w(T) \leq w(T')$

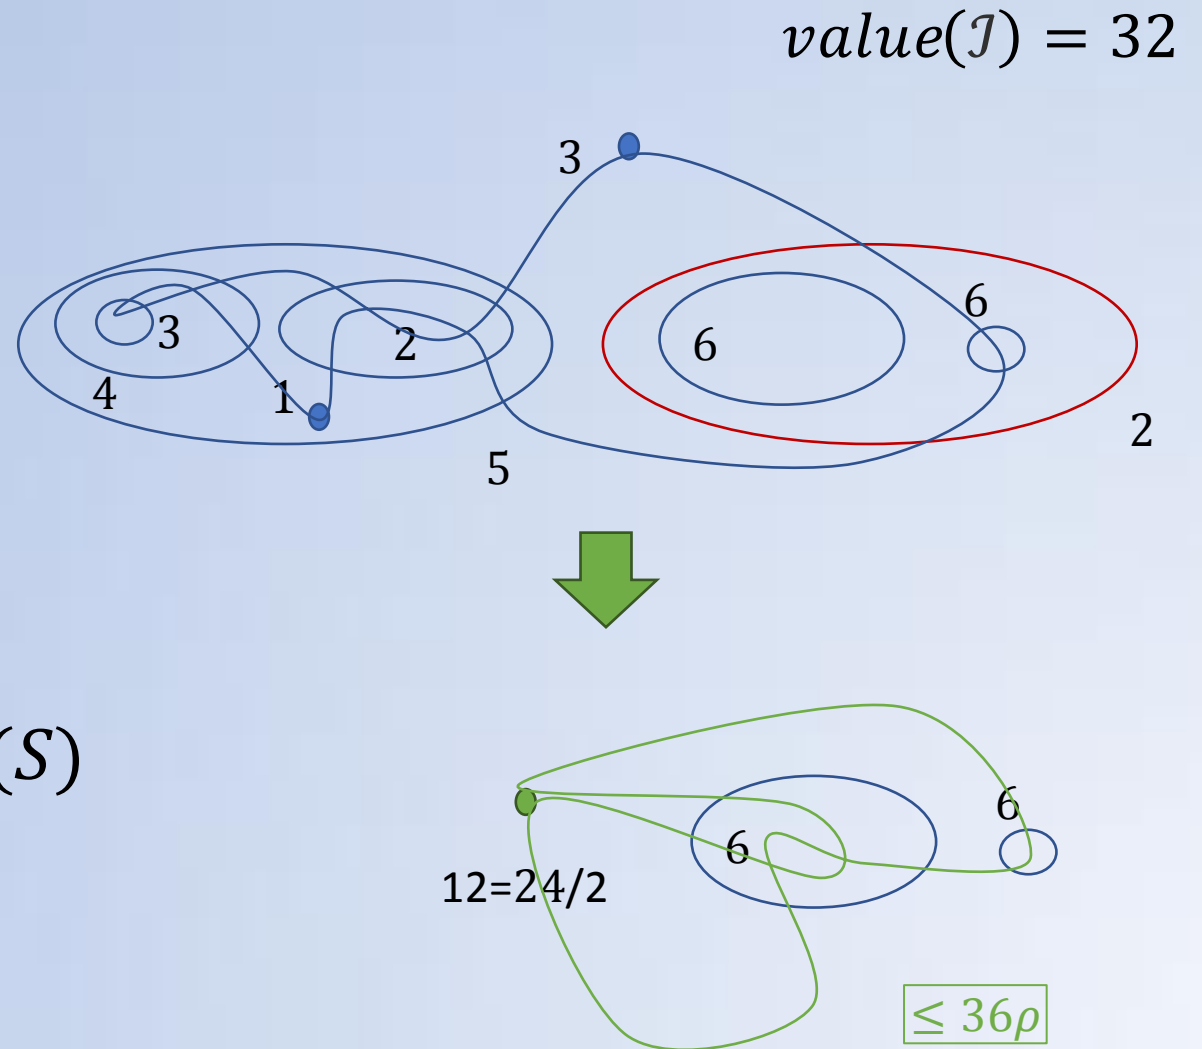

# Inducing on $S$

- We add a tour  $F_S$  inside  $S$ , using the  $\rho$ -approximation on irreducible instances.
- $\mathcal{J}''$ : remove  $S$ , and contract  $V \setminus S$  to  $\bar{s}$ , with
 
$$y_{\{\bar{s}\}} = \text{value}(S)/2$$
- $\mathcal{J}''$  is irreducible.

# Inducing on $S$

- We add a tour  $F_S$  inside  $S$ , using the  $\rho$ -approximation on irreducible instances.
- $\mathcal{J}''$ : remove  $S$ , and contract  $V \setminus S$  to  $\bar{s}$ , with
 
$$y_{\{\bar{s}\}} = value(S)/2$$
- $\mathcal{J}''$  is irreducible.
- Find tour  $F''$  in  $\mathcal{J}''$  with weight
 
$$w(F'') \leq \rho value(\mathcal{J}'') = 2\rho value(S)$$

# Inducing on $S$

- Find tour  $F''$  in  $\mathcal{J}''$  with weight  $w(F'') \leq \rho \text{value}(\mathcal{J}'') = 2\rho \text{value}(S)$
- Map back  $F''$  to  $F_S$  in  $\mathcal{J}$  with  $w(F_S) \leq w(F'') \leq 2\rho \text{value}(S)$
- $T \cup F_S$  is a tour in  $\mathcal{J}$

$$w(T \cup F_S) \leq 8\rho \left( \text{value}(\mathcal{J}) - \frac{1}{4} \text{value}(S) \right) + 2\rho \text{value}(S) = 8\rho \text{value}(\mathcal{J})$$

$$\text{value}(\mathcal{J}) = 32$$
