

# From Weak to Strong LP Gaps for all CSPs

Mrinalkanti Ghosh

Madhur Tulsiani

# Max-k-CSP

---

# Max-k-CSP

---

- $n$  Boolean variables.

# Max-k-CSP

---

- $n$  Boolean variables.
- $m$  constraints (each on  $k$  variables)

# Max-k-CSP

- $n$  Boolean variables.
- $m$  constraints (each on  $k$  variables)
- Satisfy as many as possible.

## Max-3-SAT

$$x_1 \vee x_{22} \vee \bar{x}_{19}$$

$$x_3 \vee \bar{x}_9 \vee x_{23}$$

$$x_5 \vee \bar{x}_7 \vee \bar{x}_9$$

⋮

## Max-Cut

$$x_1 \neq x_2$$

$$x_2 \neq x_5$$

$$x_3 \neq x_4$$

⋮

# Max-k-CSP<sub>q</sub>

---

## Max-k-CSP<sub>q</sub>

---

- $n$  variables taking values in  $[q] = \{0, \dots, q - 1\}$ .
- $m$  constraints (each on  $k$  variables)
- Satisfy as many as possible.

# Max-k-CSP<sub>q</sub>

- $n$  variables taking values in  $[q] = \{0, \dots, q - 1\}$ .
- $m$  constraints (each on  $k$  variables)
- Satisfy as many as possible.

## Unique Games

- For a graph, given:
  - **Set of colors:**  $[q]$
  - **Constraints:** one for each edge  $(u, v) \in E$

$$(u, v) = \left\{ \begin{array}{c} \text{green } u \\ \text{blue } v \end{array} \text{ or } \begin{array}{c} \text{blue } u \\ \text{red } v \end{array} \text{ or } \begin{array}{c} \text{red } u \\ \text{green } v \end{array} \right\}$$

# Max-k-CSP<sub>q</sub>

- $n$  variables taking values in  $[q] = \{0, \dots, q - 1\}$ .
- $m$  constraints (each on  $k$  variables)
- Satisfy as many as possible.

## Unique Games

- For a graph, given:
  - **Set of colors:**  $[q]$
  - **Constraints:** one for each edge  $(u, v) \in E$

$$(u, v) = \left\{ \begin{array}{c} \text{green } u \\ | \\ \text{blue } v \end{array} \right. \text{ or } \left. \begin{array}{c} \text{blue } u \\ | \\ \text{red } v \end{array} \right. \text{ or } \left. \begin{array}{c} \text{red } u \\ | \\ \text{green } v \end{array} \right\}$$

- Each constraint is a bijection from  $[q]$  to  $[q]$ .  
Can in fact consider difference equations

$$x_u - x_v = c_{uv} \pmod{q}$$

# Max-k-CSP<sub>q</sub>(f)

---

- Characterized by  $f : [q]^k \rightarrow \{0, 1\}$ .

# Max-k-CSP<sub>q</sub>(f)

---

- Characterized by  $f : [q]^k \rightarrow \{0, 1\}$ .
- Each constraint is of the form

$$C_i \equiv f(x_{i_1} + b_{i,1}, \dots, x_{i_k} + b_{i,k})$$

for  $i_1, \dots, i_k \in [n]$  and  $b_{i,1}, \dots, b_{i,k} \in [q]$ . (addition is mod  $q$ )

# Max-k-CSP<sub>q</sub>(f)

---

- Characterized by  $f : [q]^k \rightarrow \{0, 1\}$ .
- Each constraint is of the form

$$C_i \equiv f(x_{i_1} + b_{i,1}, \dots, x_{i_k} + b_{i,k})$$

for  $i_1, \dots, i_k \in [n]$  and  $b_{i,1}, \dots, b_{i,k} \in [q]$ . (addition is mod  $q$ )

- **Max-3-SAT**:  $f \equiv \text{OR}$ . Each  $C_i$  is a clause.  $b_{i,1} = 1$  if  $x_{i_1}$  is negated in clause  $C_i$ .

# Max-k-CSP<sub>q</sub>(f)

---

- Characterized by  $f : [q]^k \rightarrow \{0, 1\}$ .
- Each constraint is of the form

$$C_i \equiv f(x_{i_1} + b_{i,1}, \dots, x_{i_k} + b_{i,k})$$

for  $i_1, \dots, i_k \in [n]$  and  $b_{i,1}, \dots, b_{i,k} \in [q]$ . (addition is mod  $q$ )

- **Max-3-SAT**:  $f \equiv \text{OR}$ . Each  $C_i$  is a clause.  $b_{i,1} = 1$  if  $x_{i_1}$  is negated in clause  $C_i$ .
- **Unique Games**:  $f \equiv \text{EQUAL}$ . For  $i^{\text{th}}$  constraint  $(u, v)$ , let  $i_1 = u$ ,  $i_2 = v$  and let  $b_{i,2} - b_{i,1} = c_{uv}$

$$x_u - x_v = c_{uv} \quad \Leftrightarrow \quad x_{i_1} + b_{i,1} = x_{i_2} + b_{i,2}.$$

## Approximating $\text{Max-k-CSP}_q(f)$

---

Relax the problem of finding **maximum fraction** of constraints satisfiable.

# Approximating Max-k-CSP<sub>q</sub>(f)

---

Relax the problem of finding **maximum fraction** of constraints satisfiable.

# Approximating Max-k-CSP<sub>q</sub>(f)

---

Relax the problem of finding **maximum fraction** of constraints satisfiable.

- **Goal:** Distinguish the cases  $\text{OPT}(\Phi) \leq s$  and  $\text{OPT}(\Phi) > c$ .

# Approximating Max-k-CSP<sub>q</sub>(f)

---

Relax the problem of finding **maximum fraction** of constraints satisfiable.

- **Goal:** Distinguish the cases  $\text{OPT}(\Phi) \leq s$  and  $\text{OPT}(\Phi) > c$ .
- If for some  $\gamma \leq 1$ , all pairs  $(\gamma \cdot c, c)$  can be solved, then can approximate within factor  $\gamma$ .

# Characterizing approximability

---

- Max-3-SAT [Håstad 97]: For all  $\epsilon > 0$ , distinguishing  $(7/8 + \epsilon, 1 - \epsilon)$  is NP-hard ( $s < 7/8$  is trivial).

# Characterizing approximability

- **Max-3-SAT [Håstad 97]**: For all  $\epsilon > 0$ , distinguishing  $(7/8 + \epsilon, 1 - \epsilon)$  is NP-hard ( $s < 7/8$  is trivial).

- **Unique Games Conjecture [Khot 02]**: For all  $\delta, \epsilon > 0$ , there exists  $q$  such that it is NP-hard to distinguish  $(\delta, 1 - \epsilon)$  for UG with domain  $[q]$ .

## A dichotomy assuming the UGC

---

- [Raghavendra 08]: For all  $q$ , for all  $f$ , if a **basic SDP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , it is NP-hard to distinguish  $(s + \epsilon, c - \epsilon)$  **assuming the UGC**.

# A dichotomy assuming the UGC

---

- [Raghavendra 08]: For all  $q$ , for all  $f$ , if a **basic SDP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , it is NP-hard to distinguish  $(s + \epsilon, c - \epsilon)$  **assuming the UGC**.
- “All-or-nothing”: Either a simple algorithm (approximately solvable in almost linear time) can distinguish  $(s, c)$  or it is NP-hard to do so.

## A dichotomy assuming the UGC

---

- [Raghavendra 08]: For all  $q$ , for all  $f$ , if a **basic SDP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , it is NP-hard to distinguish  $(s + \epsilon, c - \epsilon)$  **assuming the UGC**.
- “All-or-nothing”: Either a simple algorithm (approximately solvable in almost linear time) can distinguish  $(s, c)$  or it is NP-hard to do so.
- Equivalent to UGC (because UG is a 2-CSP).

- For all  $q$ , for all  $f$ , if a **basic LP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , no LP of any polynomial size in the **Sherali-Adams** hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$ .

- For all  $q$ , for all  $f$ , if a **basic LP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , no LP of any polynomial size in the **Sherali-Adams** hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$ .
- [CLRS 13], [KMR 17]: If no polysize LP in Sherali-Adams hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$  then no polysize **extended formulation** can distinguish  $(s + 2\epsilon, c - 2\epsilon)$ .

- For all  $q$ , for all  $f$ , if a **basic LP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , no LP of any polynomial size in the **Sherali-Adams** hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$ .
- [CLRS 13], [KMR 17]: If no polysize LP in Sherali-Adams hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$  then no polysize **extended formulation** can distinguish  $(s + 2\epsilon, c - 2\epsilon)$ .
- “All-or-not-much” for LPs: If a simple (linear size) LP cannot do it, neither can any polysize LP extended formulation.

## (Linear) Extended formulations

---

- Defined by a **feasible polytope**  $P$ , and a way of **encoding** instances  $\Phi$  as a (linear) objective function  $w_\Phi$ .

# (Linear) Extended formulations

- Defined by a **feasible polytope**  $P$ , and a way of **encoding** instances  $\Phi$  as a (linear) objective function  $w_\Phi$ .
- Introduce additional variables  $y$ . Optimize over polytope  $P = \{x \mid \exists y \quad Ex + Fy = g, y \geq 0\}$ .

Image from [Fiorini-Rothvoss-Tiwari 2011]

Size equals  $\#variables + \#constraints$ .

# (Linear) Extended formulations

- Defined by a **feasible polytope**  $P$ , and a way of **encoding** instances  $\Phi$  as a (linear) objective function  $w_\Phi$ .
- Introduce additional variables  $y$ . Optimize over polytope  $Q = \{x \mid \exists y \quad Ex + Fy = g, y \geq 0\}$ .

Image from [Fiorini-Rothvoss-Tiwari 2011]

Size equals  $\#variables + \#constraints$ .

- Optimize objective  $\langle w_\Phi, x \rangle$  (depending on  $\Phi$ ) over  $P$ .

# Integer Program for CSPs

---

**Variables:**  $Z_{(i,b)}$  for  $i \in [n]$  and  $b \in [q]$

**Constraints:**  $(Z_{(i,b)})^2 = Z_{(i,b)} \quad \forall i \in [n], b \in [q]$

$$\sum_{b \in [q]} Z_{(i,b)} = 1 \quad \forall i \in [n]$$

# Integer Program for CSPs

---

**Variables:**  $Z_{(i,b)}$  for  $i \in [n]$  and  $b \in [q]$

**Constraints:**  $(Z_{(i,b)})^2 = Z_{(i,b)} \quad \forall i \in [n], b \in [q]$

$$\sum_{b \in [q]} Z_{(i,b)} = 1 \quad \forall i \in [n]$$

**Maximize:**  $\frac{1}{m} \cdot \sum_C \sum_{\alpha \in [q]^{S_C}} \left( \prod_{i \in S_C} Z_{(i, \alpha_i)} \right) \cdot f(\alpha + (b_{i,1}, \dots, b_{i,k}))$

# The Sherali-Adams LP hierarchy ( $t$ levels)

---

# The Sherali-Adams LP hierarchy ( $t$ levels)

---

**Variables:**  $X_{(S,\alpha)}$  for all  $|S| \leq t$  and  $\alpha \in [q]^S$ . Represent  $\tilde{\mathbb{E}}$  as

$$X_{(S,\alpha)} = \tilde{\mathbb{E}} \left[ \prod_{i \in S} Z_{(i,\alpha_i)} \right] \approx \text{Prob. vars in } S \text{ assigned according to } \alpha$$

$$X_{(S,\alpha)} \geq 0$$

# The Sherali-Adams LP hierarchy ( $t$ levels)

---

**Variables:**  $X_{(S,\alpha)}$  for all  $|S| \leq t$  and  $\alpha \in [q]^S$ . Represent  $\tilde{\mathbb{E}}$  as

$$X_{(S,\alpha)} = \tilde{\mathbb{E}} \left[ \prod_{i \in S} Z_{(i,\alpha_i)} \right] \approx \text{Prob. vars in } S \text{ assigned according to } \alpha$$

$$X_{(S,\alpha)} \geq 0$$

# The Sherali-Adams LP hierarchy ( $t$ levels)

---

**Variables:**  $X_{(S,\alpha)}$  for all  $|S| \leq t$  and  $\alpha \in [q]^S$ . Represent  $\tilde{\mathbb{E}}$  as

$$X_{(S,\alpha)} = \tilde{\mathbb{E}} \left[ \prod_{i \in S} Z_{(i,\alpha_i)} \right] \approx \text{Prob. vars in } S \text{ assigned according to } \alpha$$

$$X_{(S,\alpha)} \geq 0$$

**Consistency:** For all  $j \notin S$ ,  $\sum_{b \in [q]} X_{(S \cup \{j\}, \alpha \circ b)} = X_{(S,\alpha)}$

$$X_{\emptyset, \emptyset} = 1$$

# The Sherali-Adams LP hierarchy ( $t$ levels)

---

**Variables:**  $X_{(S,\alpha)}$  for all  $|S| \leq t$  and  $\alpha \in [q]^S$ . Represent  $\tilde{\mathbb{E}}$  as

$$X_{(S,\alpha)} = \tilde{\mathbb{E}} \left[ \prod_{i \in S} Z_{(i,\alpha_i)} \right] \approx \text{Prob. vars in } S \text{ assigned according to } \alpha$$

$$X_{(S,\alpha)} \geq 0$$

**Consistency:** For all  $j \notin S$ ,  $\sum_{b \in [q]} X_{(S \cup \{j\}, \alpha \circ b)} = X_{(S,\alpha)}$   
 $X_{(\emptyset, \emptyset)} = 1$

**Linear Program:** For variables  $X_{(S,\alpha)} \in [0, 1]$  satisfying consistency

$$\text{Maximize } \frac{1}{m} \cdot \sum_C \sum_{\alpha \in [q]^{S_C}} X_{(S_C, \alpha)} \cdot f(\alpha + (b_{i,1}, \dots, b_{i,k}))$$

## A local distribution view

## A more precise version

---

- [Ghosh T 17]: For all  $q$ , for all  $f$ , if **basic LP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , no LP given by  $t = O_\epsilon\left(\frac{\log n}{\log \log n}\right)$  levels of the **Sherali-Adams** hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$ .

## A more precise version

---

- [Ghosh T 17]: For all  $q$ , for all  $f$ , if **basic LP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , no LP given by  $t = O_\epsilon \left( \frac{\log n}{\log \log n} \right)$  levels of the **Sherali-Adams** hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$ .
- Using [CLRS 13, KMR 17]: For all  $\epsilon > 0$ , no **extended formulation** of size  $\exp \left( O_\epsilon \left( \frac{(\log n)^2}{(\log \log n)^2} \right) \right)$  can distinguish  $(s + \epsilon, c - \epsilon)$ .

## A more precise version

---

- [Ghosh T 17]: For all  $q$ , for all  $f$ , if **basic LP** cannot distinguish  $(s, c)$  for  $\text{Max-k-CSP}_q(f)$ , then for all  $\epsilon > 0$ , no LP given by  $t = O_\epsilon \left( \frac{\log n}{\log \log n} \right)$  levels of the **Sherali-Adams** hierarchy can distinguish  $(s + \epsilon, c - \epsilon)$ .
- Using [CLRS 13, KMR 17]: For all  $\epsilon > 0$ , no **extended formulation** of size  $\exp \left( O_\epsilon \left( \frac{(\log n)^2}{(\log \log n)^2} \right) \right)$  can distinguish  $(s + \epsilon, c - \epsilon)$ .
- “Escalate” a hard instance for basic LP to a hard instance for Sherali-Adams.

## What is a hard instance ( $c = 1$ )

---

- $\Phi_0$  is a  $(c, s)$  hard instance of basic LP, for  $c = 1$  if

## What is a hard instance ( $c = 1$ )

---

- $\Phi_0$  is a  $(c, s)$  hard instance of basic LP, for  $c = 1$  if
  - No assignment satisfies more than  $s$  fraction of constraints.

# What is a hard instance ( $c = 1$ )

---

- $\Phi_0$  is a  $(c, s)$  hard instance of basic LP, for  $c = 1$  if
  - No assignment satisfies more than  $s$  fraction of constraints.
  - All local distributions on constraints are supported **only on satisfying assignments**.

# What is a hard instance ( $c = 1$ )

- $\Phi_0$  is a  $(c, s)$  hard instance of basic LP, for  $c = 1$  if
  - No assignment satisfies more than  $s$  fraction of constraints.
  - All local distributions on constraints are supported **only on satisfying assignments**.

- Using  $\Phi_0$ , create a (level- $t$ ) hard instance  $\Phi$  where
  - No assignment satisfies more than  $s$  fraction of constraints.

# What is a hard instance ( $c = 1$ )

- $\Phi_0$  is a  $(c, s)$  hard instance of basic LP, for  $c = 1$  if
  - No assignment satisfies more than  $s$  fraction of constraints.
  - All local distributions on constraints are supported **only on satisfying assignments**.

- Using  $\Phi_0$ , create a (level- $t$ ) hard instance  $\Phi$  where
  - No assignment satisfies more than  $s$  fraction of constraints.
  - There exist local distributions on all subsets  $S$ ,  $|S| \leq t$ , consistent on all intersections.

# What is a hard instance ( $c = 1$ )

- $\Phi_0$  is a  $(c, s)$  hard instance of basic LP, for  $c = 1$  if
  - No assignment satisfies more than  $s$  fraction of constraints.
  - All local distributions on constraints are supported **only on satisfying assignments**.

- Using  $\Phi_0$ , create a (level- $t$ ) hard instance  $\Phi$  where
  - No assignment satisfies more than  $s$  fraction of constraints.
  - There exist local distributions on all subsets  $S$ ,  $|S| \leq t$ , consistent on all intersections.
  - Distribution on  $S$  only supported on assignments satisfying (almost) **all constraints in  $S$** .

## Intuition for the proof

---

- Use hard instance (say  $\Phi_0$ ) for basic LP as a “template” to produce a hard instance  $\Phi$  for Sherali-Adams.

## Intuition for the proof

---

- Use hard instance (say  $\Phi_0$ ) for basic LP as a “template” to produce a hard instance  $\Phi$  for Sherali-Adams.
- Instance  $\Phi$  looks “easily satisfiable” locally.

## Intuition for the proof

---

- Use hard instance (say  $\Phi_0$ ) for basic LP as a “template” to produce a hard instance  $\Phi$  for Sherali-Adams.
- Instance  $\Phi$  looks “easily satisfiable” locally.
- Think of instance as (hyper)graph. Each constraint adds a hyperedge. Locally like (hyper)trees.

## Intuition for the proof

---

- Use hard instance (say  $\Phi_0$ ) for basic LP as a “template” to produce a hard instance  $\Phi$  for Sherali-Adams.
- Instance  $\Phi$  looks “easily satisfiable” locally.
- Think of instance as (hyper)graph. Each constraint adds a hyperedge. Locally like (hyper)trees.
- Trees are easy.

# The gap construction

---

- Will use  $(s, c)$  hard instance  $\Phi_0$  for basic LP as template.

# The gap construction

- Will use  $(s, c)$  hard instance  $\Phi_0$  for basic LP as template.
- Consider a bucket of variables  $B_r$  for every variable  $x_r$  in  $\Phi_0$ .  $|B_r| = n$ .

# The gap construction

- Will use  $(s, c)$  hard instance  $\Phi_0$  for basic LP as template.
- Consider a bucket of variables  $B_r$  for every variable  $x_r$  in  $\Phi_0$ .  $|B_r| = n$ .
- Repeat  $m$  times:
  - Sample  $C \sim \Phi_0$ . Let  $C \equiv f(x_{i_1} + b_{i,1}, \dots, x_{i_k} + b_{i,k})$ .

# The gap construction

- Will use  $(s, c)$  hard instance  $\Phi_0$  for basic LP as template.
- Consider a bucket of variables  $B_r$  for every variable  $x_r$  in  $\Phi_0$ .  $|B_r| = n$ .
- Repeat  $m$  times:
  - Sample  $C \sim \Phi_0$ . Let  $C \equiv f(x_{i_1} + b_{i,1}, \dots, x_{i_k} + b_{i,k})$ .
  - Pick  $j^{\text{th}}$  variable uniformly from bucket  $B_{i_j}$ . Let  $z_{i_j}$  be the sampled variable from this bucket.

# The gap construction

- Will use  $(s, c)$  hard instance  $\Phi_0$  for basic LP as template.
- Consider a bucket of variables  $B_r$  for every variable  $x_r$  in  $\Phi_0$ .  $|B_r| = n$ .
- Repeat  $m$  times:
  - Sample  $C \sim \Phi_0$ . Let  $C \equiv f(x_{i_1} + b_{i_1,1}, \dots, x_{i_k} + b_{i_k,k})$ .
  - Pick  $j^{\text{th}}$  variable uniformly from bucket  $B_{i_j}$ . Let  $z_{i_j}$  be the sampled variable from this bucket.
  - Include constraint  $f(z_{i_1} + b_{i_1,1}, \dots, z_{i_k} + b_{i_k,k})$ .

# The gap construction

- Will use  $(s, c)$  hard instance  $\Phi_0$  for basic LP as template.
- Consider a bucket of variables  $B_r$  for every variable  $x_r$  in  $\Phi_0$ .  $|B_r| = n$ .
- Repeat  $m$  times:
  - Sample  $C \sim \Phi_0$ . Let  $C \equiv f(x_{i_1} + b_{i,1}, \dots, x_{i_k} + b_{i,k})$ .
  - Pick  $j^{\text{th}}$  variable uniformly from bucket  $B_{i_j}$ . Let  $z_{i_j}$  be the sampled variable from this bucket.
  - Include constraint  $f(z_{i_1} + b_{i,1}, \dots, z_{i_k} + b_{i,k})$ .
- Similar constructions used by [GL 15], [KTW 14]

# Bounding $\text{OPT}(\Phi)$

- Fix an assignment  $\sigma$  to all vars in new instance  $\Phi$

# Bounding $\text{OPT}(\Phi)$

- Fix an assignment  $\sigma$  to all vars in new instance  $\Phi$
- Let  $D_r$  be the empirical distribution on  $[q]$  for variables in  $B_r$ .

# Bounding $\text{OPT}(\Phi)$

- Fix an assignment  $\sigma$  to all vars in new instance  $\Phi$
- Let  $D_r$  be the empirical distribution on  $[q]$  for variables in  $B_r$ .

# Bounding $\text{OPT}(\Phi)$

- Fix an assignment  $\sigma$  to all vars in new instance  $\Phi$
- Let  $D_r$  be the empirical distribution on  $[q]$  for variables in  $B_r$ .
- Let  $x_r$  be a var in constraint  $C \in \Phi_0$ . A random copy of  $C$  sees a value for this variable independently distributed with  $D_r$ .

# Bounding $\text{OPT}(\Phi)$

- Fix an assignment  $\sigma$  to all vars in new instance  $\Phi$
- Let  $D_r$  be the empirical distribution on  $[q]$  for variables in  $B_r$ .
- Let  $x_r$  be a var in constraint  $C \in \Phi_0$ . A random copy of  $C$  sees a value for this variable independently distributed with  $D_r$ .
- For a fixed  $\sigma$ ,

$$\mathbb{E}_{\Phi} [\text{Fraction of sat. constraints in } \Phi]$$

equals fraction satisfied in  $\Phi_0$  by rounding each  $x_r$  independently from  $D_r$  ( $\leq s$ ).

# Bounding $\text{OPT}(\Phi)$

- Fix an assignment  $\sigma$  to all vars in new instance  $\Phi$
- Let  $D_r$  be the empirical distribution on  $[q]$  for variables in  $B_r$ .

- For a fixed  $\sigma$ ,
  - $\mathbb{E}_\Phi$  [Fraction of sat. constraints in  $\Phi$ ]
 equals fraction satisfied in  $\Phi_0$  by rounding each  $x_r$  independently from  $D_r$  ( $\leq s$ ).
- Concentration and union bound.

# Propagation on trees

---

- Random hypergraphs have no cycles of size  $O(\log n)$ . Locally like trees.

# Propagation on trees

---

- Random hypergraphs have no cycles of size  $O(\log n)$ . Locally like trees.
- Each hyperedge  $e$  in a tree comes from a constraint in  $\Phi_0$ . Comes with a given distribution on  $e$  (from basic LP).

# Propagation on trees

- Random hypergraphs have no cycles of size  $O(\log n)$ . Locally like trees.
- Each hyperedge  $e$  in a tree comes from a constraint in  $\Phi_0$ . Comes with a given distribution on  $e$  (from basic LP).
- Propagate to child conditioned on parent. Can be done by consistency on variables (vertices).
